1. INTRODUCTION

- $\mathcal{H}_{AB} = \mathcal{H}_A \otimes \mathcal{H}_B$ (or $\mathcal{H}_{ABC} = \mathcal{H}_A \otimes \mathcal{H}_B \otimes \mathcal{H}_C$).
- $\mathcal{B}_\Lambda := \mathcal{B}(\mathcal{H}_\Lambda)$, set of bounded linear operators.
- $\mathcal{A}_\Lambda \subseteq \mathcal{B}_\Lambda$, set of Hermitian operators.
- $\mathcal{S}_\Lambda := \{f \in \mathcal{A}_\Lambda : f \geq 0 \text{ and } \text{tr}[f] = 1\}$.
- $f \in \mathcal{B}_\Lambda$ has support on $A \subseteq \Lambda$ if $f = f_A \otimes \mathbb{1}_B$ for certain $f_A \in \mathcal{B}_A$.
- Modified partial trace: $\text{tr}_A : f \mapsto \text{tr}_A[f] \otimes \mathbb{1}_A$, where $\text{tr}_A[f]$ has support in B .
- We denote by f_B the observable $\text{tr}_A[f]$ with support in B .

2. MOTIVATION

MOTIVATION

Figura: An open quantum many-body system.

- Interesting for information processing \Rightarrow Open (unavoidable interactions).
- Dynamics of S is dissipative!
- The continuous-time evolution of a state on S is given by a **quantum Markov semigroup**.

MOTIVATION

Figura: A quantum spin lattice system.

- Lattice $\Lambda \subset \mathbb{Z}^d$.
- For every site x , $\mathcal{H}_x (= \mathbb{C}^D)$.
- The global Hilbert space associated to Λ is $\mathcal{H}_\Lambda = \bigotimes_{x \in \Lambda} \mathcal{H}_x$.

DISSIPATIVE QUANTUM SYSTEM

DISSIPATIVE QUANTUM SYSTEMS

A **dissipative quantum system** is a 1-parameter continuous semigroup $\{\mathcal{T}_t^*\}_{t \geq 0}$ of completely positive, trace preserving (CPTP) maps (a.k.a. quantum channels) in \mathcal{S}_Λ .

- *Positive*: Maps positive operators to positive operators.
- *Completely positive*: $\mathcal{T}_t^* \otimes \mathbb{1} : \mathcal{S}_\Lambda \otimes \mathcal{M}_n \rightarrow \mathcal{S}_\Lambda \otimes \mathcal{M}_n$ is positive $\forall n \in \mathbb{N}, \forall t \geq 0$.
- *Trace preserving*: $\text{tr}[\mathcal{T}_t^*(\rho_\Lambda)] = \text{tr}[\rho_\Lambda] \quad \forall \rho_\Lambda \in \mathcal{S}_\Lambda, \forall t \geq 0$.

Semigroup:

- $\mathcal{T}_t^* \circ \mathcal{T}_s^* = \mathcal{T}_{t+s}^*$.
- $\mathcal{T}_0^* = \mathbb{1}$.

PRIMITIVE QMS

We assume that $\{\mathcal{T}_t^*\}_{t \geq 0}$ has a unique full-rank invariant state, which we denote by σ_Λ .

REVERSIBILITY

We also assume that the quantum Markov process studied is **reversible**, i.e., satisfies the **detailed balance condition**:

$$\langle \rho_\Lambda, \mathcal{L}_\Lambda^*(\eta_\Lambda) \rangle_{\sigma_\Lambda} = \langle \mathcal{L}_\Lambda^*(\rho_\Lambda), \eta_\Lambda \rangle_{\sigma_\Lambda}$$

for every $\rho_\Lambda, \eta_\Lambda \in \mathcal{S}_\Lambda$.

MIXING TIME

We define the **mixing time** of \mathcal{T}_t^* by

$$\tau(\varepsilon) = \min \left\{ t > 0 : \sup_{\rho_\Lambda \in \mathcal{S}_\Lambda} \|\mathcal{T}_t^*(\rho_\Lambda) - \mathcal{T}_\infty^*(\rho_\Lambda)\|_1 \leq \varepsilon \right\}.$$

RAPID MIXING

We say that \mathcal{L}_Λ^* satisfies **rapid mixing** if

$$\sup_{\rho \in \mathcal{S}_\Lambda} \|\rho_t - \sigma_\Lambda\|_1 \leq \text{poly}(|\Lambda|) e^{-\gamma t}.$$

LOG-SOBOLEV INEQUALITY (MLSI)

Let σ_Λ be the stationary state of a semigroup generated by the quantum dynamical master equation

$$\partial_t \rho_t = \mathcal{L}_\Lambda^*(\rho_t), \quad (1)$$

where \mathcal{L}_Λ is the Liouvillian in the Heisenberg picture.

We define the **relative entropy** of ρ_t and σ_Λ by:

$$D(\rho_t || \sigma_\Lambda) = \text{tr}[\rho_t(\log \rho_t - \log \sigma_\Lambda)]. \quad (2)$$

Therefore, since ρ_t evolves according to \mathcal{L}_Λ^* , the derivate of $D(\rho_t || \sigma_\Lambda)$ is given by

$$\partial_t D(\rho_t || \sigma_\Lambda) = \text{tr}[\mathcal{L}_\Lambda^*(\rho_t)(\log \rho_t - \log \sigma_\Lambda)], \quad (3)$$

and we want to find a lower bound for the derivative of $D(\rho_t || \sigma_\Lambda)$ in terms of itself:

$$2\alpha D(\rho_t || \sigma_\Lambda) \leq -\text{tr}[\mathcal{L}_\Lambda^*(\rho_t)(\log \rho_t - \log \sigma_\Lambda)]. \quad (4)$$

3. CLASSICAL CASE

CLASSICAL ENTROPY AND CONDITIONAL ENTROPY

Consider a probability space $(\Omega, \mathcal{F}, \mu)$ and define, for every $f > 0$, the **entropy** of f by

$$\text{Ent}_\mu(f) = \mu(f \log f) - \mu(f) \log \mu(f).$$

Given a σ -algebra $\mathcal{G} \subseteq \mathcal{F}$, we define the **conditional entropy** of f in \mathcal{G} by

$$\text{Ent}_\mu(f | \mathcal{G}) = \mu(f \log f | \mathcal{G}) - \mu(f | \mathcal{G}) \log \mu(f | \mathcal{G}).$$

With these definitions, the following lemma is proven:

LEMMA, Dai Pra et al. '02

Let $(\Omega, \mathcal{F}, \mu)$ be a probability space, and $\mathcal{F}_1, \mathcal{F}_2$ sub- σ -algebras of \mathcal{F} . Suppose that there exists a probability measure $\bar{\mu}$ that makes \mathcal{F}_1 and \mathcal{F}_2 independent, $\mu \ll \bar{\mu}$ and $\mu | \mathcal{F}_i = \bar{\mu} | \mathcal{F}_i$ for $i = 1, 2$. Then, for every $f \geq 0$ such that $f \log f \in L^1(\mu)$ and $\mu(f) = 1$,

$$\text{Ent}_{\mu}(f) \leq \frac{1}{1 - 4\|h - 1\|_{\infty}} \mu [\text{Ent}_{\mu}(f | \mathcal{F}_1) + \text{Ent}_{\mu}(f | \mathcal{F}_2)],$$

where $h = \frac{d\mu}{d\bar{\mu}}$.

PROBLEM

Let $\mathcal{H}_{ABC} = \mathcal{H}_A \otimes \mathcal{H}_B \otimes \mathcal{H}_C$ and $\rho_{ABC}, \sigma_{ABC} \in \mathcal{S}_{ABC}$. Can we prove something like

$$D(\rho_{ABC} || \sigma_{ABC}) \leq \xi(\sigma_{AB}) [D_{AB}(\rho_{ABC} || \sigma_{ABC}) + D_{BC}(\rho_{ABC} || \sigma_{ABC})] ?$$

Yes! (We will see how later)

4. CONDITIONAL RELATIVE ENTROPY

QUANTUM RELATIVE ENTROPY

Let $f, g \in \mathcal{A}_\Lambda$, f verifying $\text{tr}[f] \neq 0$. The **quantum relative entropy** of f and g is defined by:

$$D(f||g) = \frac{1}{\text{tr}[f]} \text{tr} [f(\log f - \log g)]. \quad (7)$$

REMARK

In this talk, we only consider density matrices (with trace 1). In this case, the **quantum relative entropy** is given by:

$$D(\rho||\sigma) = \text{tr} [\rho(\log \rho - \log \sigma)]. \quad (8)$$

PROPERTIES OF THE RELATIVE ENTROPY

Let $\mathcal{H}_{AB} = \mathcal{H}_A \otimes \mathcal{H}_B$ and $\rho_{AB}, \sigma_{AB} \in \mathcal{S}_{AB}$. The following properties hold:

- 1 **Continuity.** $\rho_{AB} \mapsto D(\rho_{AB} || \sigma_{AB})$ is continuous.
- 2 **Additivity.** $D(\rho_A \otimes \rho_B || \sigma_A \otimes \sigma_B) = D(\rho_A || \sigma_A) + D(\rho_B || \sigma_B)$.
- 3 **Superadditivity.**
 $D(\rho_{AB} || \sigma_A \otimes \sigma_B) \geq D(\rho_A || \sigma_A) + D(\rho_B || \sigma_B)$.
- 4 **Monotonicity.** $D(\rho_{AB} || \sigma_{AB}) \geq D(T(\rho_{AB}) || T(\sigma_{AB}))$ for every quantum channel T .

CHARACTERIZATION OF THE RELATIVE ENTROPY, Wilming et al. '17, Matsumoto '10

If $f : \mathcal{S}_{AB} \times \mathcal{S}_{AB} \rightarrow \mathbb{R}_0^+$ satisfies 1 – 4, then f is the relative entropy.

PROPERTIES OF THE RELATIVE ENTROPY

Let $\mathcal{H}_{AB} = \mathcal{H}_A \otimes \mathcal{H}_B$ and $\rho_{AB}, \sigma_{AB} \in \mathcal{S}_{AB}$. The following properties hold:

- 1 **Continuity.** $\rho_{AB} \mapsto D(\rho_{AB}||\sigma_{AB})$ is continuous.
- 2 **Additivity.** $D(\rho_A \otimes \rho_B || \sigma_A \otimes \sigma_B) = D(\rho_A || \sigma_A) + D(\rho_B || \sigma_B)$.
- 3 **Superadditivity.**

$$D(\rho_{AB} || \sigma_A \otimes \sigma_B) \geq D(\rho_A || \sigma_A) + D(\rho_B || \sigma_B).$$
- 4 **Monotonicity.** $D(\rho_{AB} || \sigma_{AB}) \geq D(T(\rho_{AB}) || T(\sigma_{AB}))$ for every quantum channel T .

CHARACTERIZATION OF THE RELATIVE ENTROPY, Wilming et al. '17, Matsumoto '10

If $f : \mathcal{S}_{AB} \times \mathcal{S}_{AB} \rightarrow \mathbb{R}_0^+$ satisfies 1 – 4, then f is the relative entropy.

CONDITIONAL RELATIVE ENTROPY

CONDITIONAL RELATIVE ENTROPY

Let $\mathcal{H}_{AB} = \mathcal{H}_A \otimes \mathcal{H}_B$. We define a **conditional relative entropy** in A as a function

$$D_A(\cdot || \cdot) : \mathcal{S}_{AB} \times \mathcal{S}_{AB} \rightarrow \mathbb{R}_0^+$$

verifying the following properties for every $\rho_{AB}, \sigma_{AB} \in \mathcal{S}_{AB}$:

① **Continuity:** The map $\rho_{AB} \mapsto D_A(\rho_{AB} || \sigma_{AB})$ is continuous.

② **Non-negativity:** $D_A(\rho_{AB} || \sigma_{AB}) \geq 0$ and

$$(2.1) \quad D_A(\rho_{AB} || \sigma_{AB}) = 0 \text{ iff } \rho_{AB} = \sigma_{AB}^{1/2} \sigma_B^{-1/2} \rho_B \sigma_B^{-1/2} \sigma_{AB}^{1/2}.$$

③ **Semi-superadditivity:** $D_A(\rho_{AB} || \sigma_A \otimes \sigma_B) \geq D(\rho_A || \sigma_A)$ and

$$(3.1) \quad \text{Semi-additivity: if } \rho_{AB} = \rho_A \otimes \rho_B, \\ D_A(\rho_A \otimes \rho_B || \sigma_A \otimes \sigma_B) = D(\rho_A || \sigma_A).$$

④ **Semi-monotonicity:** For every quantum channel \mathcal{T} ,

$$D_A(\mathcal{T}(\rho_{AB}) || \mathcal{T}(\sigma_{AB})) + D_B((\text{tr}_A \circ \mathcal{T})(\rho_{AB}) || (\text{tr}_A \circ \mathcal{T})(\sigma_{AB})) \\ \leq D_A(\rho_{AB} || \sigma_{AB}) + D_B(\text{tr}_A(\rho_{AB}) || \text{tr}_A(\sigma_{AB})).$$

REMARK

Consider for every $\rho_{AB}, \sigma_{AB} \in \mathcal{S}_{AB}$

$$D_{A,B}^+(\rho_{AB}||\sigma_{AB}) = D_A(\rho_{AB}||\sigma_{AB}) + D_B(\rho_{AB}||\sigma_{AB}).$$

Then, $D_{A,B}^+$ verifies the following properties:

- 1 **Continuity:** $\rho_{AB} \mapsto D_{A,B}^+(\rho_{AB}||\sigma_{AB})$ is continuous.
- 2 **Additivity:**
$$D_{A,B}^+(\rho_A \otimes \rho_B || \sigma_A \otimes \sigma_B) = D(\rho_A || \sigma_A) + D(\rho_B || \sigma_B).$$
- 3 **Superadditivity:**
$$D_{A,B}^+(\rho_{AB} || \sigma_A \otimes \sigma_B) \geq D(\rho_A || \sigma_A) + D(\rho_B || \sigma_B).$$

However, it does not satisfy the property of monotonicity.

AXIOMATIC CHARACTERIZATION OF THE CONDITIONAL RELATIVE ENTROPY

The only possible conditional relative entropy is given by:

$$D_A(\rho_{AB}||\sigma_{AB}) = D(\rho_{AB}||\sigma_{AB}) - D(\rho_B||\sigma_B)$$

for every $\rho_{AB}, \sigma_{AB} \in \mathcal{S}_{AB}$.

Figura: Choice of indices in $\mathcal{H}_{ABC} = \mathcal{H}_A \otimes \mathcal{H}_B \otimes \mathcal{H}_C$.

Result of **quasi-factorization** of the relative entropy, for every $\rho_{ABC}, \sigma_{ABC} \in \mathcal{S}_{ABC}$:

$$D(\rho_{ABC} || \sigma_{ABC}) \leq \xi(\sigma_{ABC}) [D_{AB}(\rho_{ABC} || \sigma_{ABC}) + D_{BC}(\rho_{ABC} || \sigma_{ABC})],$$

where $\xi(\sigma_{ABC})$ depends only on σ_{ABC} and measures how far σ_{AC} is from $\sigma_A \otimes \sigma_C$.

QUASI-FACTORIZATION FOR THE CRE

Let $\mathcal{H}_{ABC} = \mathcal{H}_A \otimes \mathcal{H}_B \otimes \mathcal{H}_C$ and $\rho_{ABC}, \sigma_{ABC} \in \mathcal{S}_{ABC}$. Then, the following inequality holds

$$(1 - 2\|H(\sigma_{AC})\|_\infty)D(\rho_{ABC}||\sigma_{ABC}) \leq D_{AB}(\rho_{ABC}||\sigma_{ABC}) + D_{BC}(\rho_{ABC}||\sigma_{ABC}),$$

5. CONDITIONAL RELATIVE ENTROPY BY EXPECTATIONS

WEAK CONDITIONAL RELATIVE ENTROPY

Let $\mathcal{H}_{AB} = \mathcal{H}_A \otimes \mathcal{H}_B$. We define a **weak conditional relative entropy** in A as a function

$$D_A(\cdot || \cdot) : \mathcal{S}_{AB} \times \mathcal{S}_{AB} \rightarrow \mathbb{R}_0^+$$

verifying the following properties for every $\rho_{AB}, \sigma_{AB} \in \mathcal{S}_{AB}$:

- 1 **Continuity:** The map $\rho_{AB} \mapsto D_A(\rho_{AB} || \sigma_{AB})$ is continuous.
- 2 **Non-negativity:** $D_A(\rho_{AB} || \sigma_{AB}) \geq 0$ and
 (2.1) $D_A(\rho_{AB} || \sigma_{AB}) = 0$ if, and only if, $\rho_{AB} = \mathbb{E}_A^*(\rho_{AB})$.
- 3 **Semi-superadditivity:** $D_A(\rho_{AB} || \sigma_A \otimes \sigma_B) \geq D(\rho_A || \sigma_A)$ and
 (3.1) **Semi-additivity:** if $\rho_{AB} = \rho_A \otimes \rho_B$,
 $D_A(\rho_A \otimes \rho_B || \sigma_A \otimes \sigma_B) = D(\rho_A || \sigma_A)$.

MINIMAL CONDITIONAL EXPECTATION

Let $\mathcal{H}_{AB} = \mathcal{H}_A \otimes \mathcal{H}_B$ and $\sigma_{AB} \in \mathcal{S}_{AB}$, $f_{AB} \in \mathcal{A}_{AB}$. We define the **minimal conditional expectation** of σ_{AB} on A by

$$\mathbb{E}_A^\sigma(f_{AB}) := \text{tr}_A[\eta_A^\sigma f_{AB} \eta_A^{\sigma\dagger}], \quad (9)$$

where $\eta_A^\sigma := (\text{tr}_A[\sigma_{AB}])^{-1/2} \sigma_{AB}^{1/2}$.

For $\rho_{AB} \in \mathcal{S}_{AB}$, $(\mathbb{E}_A^\sigma)^*$ (hereafter denoted by \mathbb{E}_A^*) is given by

$$\mathbb{E}_A^*(\rho_{AB}) := \sigma_{AB}^{1/2} \sigma_B^{-1/2} \rho_B \sigma_B^{-1/2} \sigma_{AB}^{1/2}. \quad (10)$$

It coincides with the Petz recovery map for the partial trace.

STEP 1

$$D(\rho_{AB}||\sigma_{AB}) \geq D(\rho_A||\sigma_A) + D(\rho_B||\sigma_B) - \log \operatorname{tr} M, \quad (13)$$

where $M = \exp [\log \sigma_{AB} - \log \sigma_A \otimes \sigma_B + \log \rho_A \otimes \rho_B]$.

It holds that:

$$\begin{aligned} & D(\rho_{AB}||\sigma_{AB}) - [D(\rho_A||\sigma_A) + D(\rho_B||\sigma_B)] = \\ & = \operatorname{tr} \left[\rho_{AB} \left(\log \rho_{AB} - \underbrace{(\log \sigma_{AB} - \log \sigma_A \otimes \sigma_B + \log \rho_A \otimes \rho_B)}_{\log M} \right) \right] \\ & = D(\rho_{AB}||M) \geq -\log \operatorname{tr} M. \end{aligned}$$

STEP 2

$$\log \operatorname{tr} M \leq \operatorname{tr}[L(\sigma_{AB})(\rho_A - \sigma_A) \otimes (\rho_B - \sigma_B)], \quad (14)$$

where

$$L(\sigma_{AB}) = \mathcal{T}_{\sigma_A \otimes \sigma_B}(\sigma_{AB}) - \mathbb{1}_{AB}.$$

THEOREM (LIEB)

Let g a positive operator, and define

$$\mathcal{T}_g(f) = \int_0^\infty dt (g+t)^{-1} f (g+t)^{-1}.$$

\mathcal{T}_g is positive-semidefinite if g is. We have that

$$\mathrm{tr}[\exp(-f + g + h)] \leq \mathrm{tr}[e^h \mathcal{T}_{ef}(e^g)].$$

We apply Lieb's theorem to the previous equation :

$$\begin{aligned} \mathrm{tr} M &\leq \mathrm{tr}[\rho_A \otimes \rho_B \mathcal{T}_{\sigma_A \otimes \sigma_B}(\sigma_{AB})] \\ &= \mathrm{tr} \left[\rho_A \otimes \rho_B \underbrace{(\mathcal{T}_{\sigma_A \otimes \sigma_B}(\sigma_{AB}) - \mathbb{1}_{AB})}_{L(\sigma_{AB})} \right] + \underbrace{\mathrm{tr}[\rho_A \otimes \rho_B]}_1. \end{aligned}$$

By using the fact $\log(x) \leq x - 1$, we conclude

$$\log \mathrm{tr} M \leq \mathrm{tr} M - 1 \leq \mathrm{tr}[L(\sigma_{AB}) \rho_A \otimes \rho_B].$$

LEMMA (SUTTER ET AL.)

For $f \in \mathcal{S}_{AB}$ and $g \in \mathcal{A}_{AB}$ the following holds:

$$\mathcal{T}_g(f) = \int_{-\infty}^{\infty} dt \beta_0(t) g^{\frac{-1-it}{2}} f g^{\frac{-1+it}{2}},$$

with

$$\beta_0(t) = \frac{\pi}{2} (\cosh(\pi t) + 1)^{-1}.$$

LEMMA

For every operator $O_A \in \mathcal{B}_A$ and $O_B \in \mathcal{B}_B$ the following holds:

$$\text{tr}[L(\sigma_{AB}) \sigma_A \otimes O_B] = \text{tr}[L(\sigma_{AB}) O_A \otimes \sigma_B] = 0.$$

STEP 3

$$\mathrm{tr}[L(\sigma_{AB})(\rho_A - \sigma_A) \otimes (\rho_B - \sigma_B)] \leq 2\|L(\sigma_{AB})\|_\infty D(\rho_{AB}||\sigma_{AB}). \quad (15)$$

In virtue of Hölder's inequality and tensorization of Schatten norms,

$$\begin{aligned} \mathrm{tr}[L(\sigma_{AB})(\rho_A - \sigma_A) \otimes (\rho_B - \sigma_B)] &\leq \\ &\|L(\sigma_{AB})\|_\infty \|(\rho_A - \sigma_A) \otimes (\rho_B - \sigma_B)\|_1 \\ &= \|L(\sigma_{AB})\|_\infty \|\rho_A - \sigma_A\|_1 \|\rho_B - \sigma_B\|_1. \end{aligned}$$

Theorem (Pinsker)

For ρ_{AB} and σ_{AB} density matrices, it holds that

$$\|\rho_{AB} - \sigma_{AB}\|_1^2 \leq 2D(\rho_{AB}||\sigma_{AB}).$$

Using Pinsker's theorem and the data-processing inequality, we can conclude:

$$\text{tr}[L(\sigma_{AB})(\rho_A - \sigma_A) \otimes (\rho_B - \sigma_B)] \leq 2\|L(\sigma_{AB})\|_\infty D(\rho_{AB}||\sigma_{AB}).$$
